## Cost Controls

*The VNext Backend was explicitly prepared to be highly scalable at a low cost per transaction. I have provided software for another client running on similar architecture that serves roughly 720,000,000 api request per day, including computationally expensive data aggregation, and alert monitoring, on pennies per connected device, running in google cloud. I expect similar patterns on jetzy although due to the exponential nature of social groups we will still need be mindful of additional tuning and cost controls*

{Acceptable cost per user.}

{Service Ability Requirements}

{Traffic Variance}

{Traffic Variance}

- Relatively flat traffic is a good candidate for collocation or hybrid models.  
- Random unexpected spikes are a strong signal for cloud or hybrid.  
- Predictable traffic patterns may indicate colo or hybrid depending on frequency and severity of dips and spikes.
